Application/Control Number: 10/531,505

Art Unit: 3767

#### **DETAILED ACTION**

#### **Drawings**

1. The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the drive member, the dosing member, the pivoting element of the actuator, the rack and pinion gearing, the means for biasing, and the means for permitting must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as "amended." If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. Each drawing sheet submitted after the filling date of an application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

## Specification

2. The specification is objected to as failing to provide proper antecedent basis for the claimed subject matter. See 37 CFR 1.75(d)(1) and MPEP § 608.01(o). Correction of the following is required: The specification fails to disclose a pivoting element, a rack and pinion gearing, a means for biasing, and a means for permitting. The specification also fails to disclose the dosing member being manually rotatable to selectively set the dose wherein rotation of the dosing member to increase the dose setting causes the dosing member to move in a direction opposite the distal direction from a retracted position to one of a plurality of extended positions.

#### Claim Objections

3. Claim 5 is objected to because of the following informalities: Claim 5 recites the limitation "said rack" in line 2. There is insufficient antecedent basis for this limitation in the claim. It is unclear if the rack in line 2 is referring to the rack of the rack and pinion gearing recited in claim 4 or an additional rack is being claimed. Appropriate correction is required.

# Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the

Art Unit: 3767

applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

5. Claims 1-12 are rejected under 35 U.S.C. 102(e) as being anticipated by Hjertman et al (U.S. Patent No. 6,599,272). Hjertman et al disclose a medication dispensing apparatus having a housing (210), a drive member (271), a fluid container defining a medicine-filled reservoir (220) with a movable piston (225), and a dosing and injection assembly. The dosing and injecting assembly includes an actuator (230) with a pivoting element (239) and a dosing member (250). The dosing and injecting assembly also includes a rack and pinion gearing (242, 251, 252) between the actuator and the dosing member. A portion of the dosing member within the housing comprises the rack of the rack and pinion gearing. The actuator comprises at least apportion of a ring gear (242') in engagement with a pinion (243). The apparatus also includes a means for biasing the dosing member (281). As to claims 11 and 12, the dosing and injecting assembly includes a drive screw (243) rotatable with the dosing member (250) and threadedly engaged with the drive member and further includes means for permitting (244) the drive screw to rotate relative to the dosing member.

#### Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Epstein et al (U.S. Patent No. 6,007,515), Streck et al (U.S. Patent No. 6,364.860), and Miller et al (U.S. Patent No. 6,945,961) disclose medication dispensing apparatus.
